PRODUCTION RELEASE REPORT · OCTOBER 2026

# Storefront

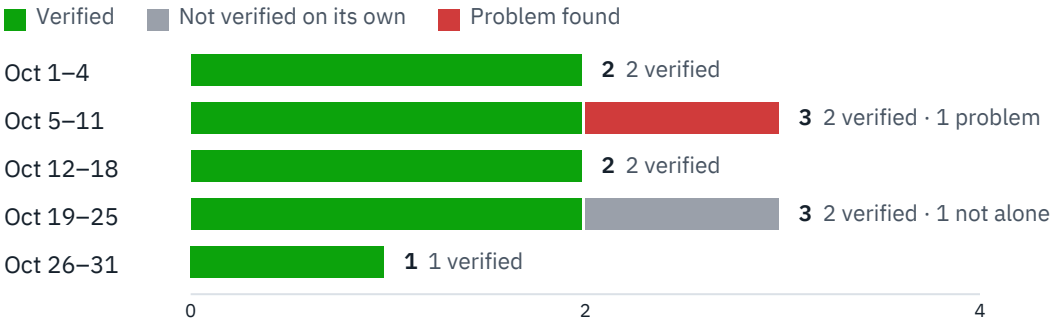

Production · prepared by Your agency

11 releases went to production this month. 9 were verified healthy against real traffic, typically 18 minutes after going live. One had a problem, which was caught automatically. The Ruby 3.3.6 to 3.4.7 upgrade and the Rails 7.2.2 to 8.0.3 upgrade went out and were verified.

| 11 | 9 82% | 1 | 18 min |
|---|---|---|---|
| **Releases shipped** | **Verified in production** | **Problems found** | **Typical time to verified** |
| About 2 a week | Each on its own traffic | 1 resolved since | Median, from going live |

## Releases by week

One bar per week. Busy weeks mean more releases replaced within minutes by the next one, before enough traffic reached them to verify them alone.

## Problems found

Found by comparing each release with how the app ran before it. Nobody had to be watching.

Oct 9

### Pages got slower v121

Response times on GET /checkout rose from 310 ms to 1180 ms for the slowest 5% of requests after this release went out.

**Resolved** Release v122 was verified 32 minutes later.

## Scheduled jobs

2 scheduled jobs watched between releases, with an alert when one misses a run or fails.

`SendInvoicesJob` missed its run due Oct 18, 07:00 EDT; running again Oct 18, 10:22 EDT.

## Upgrades and riskier changes

Changes that usually need someone to keep an eye on production afterwards.

**Ruby 3.3.6 to 3.4.7**
Oct 21, in one release: verified.

**Rails 7.2.2 to 8.0.3**
Oct 21, in one release: verified.

**2 releases changed the database**
None had a problem. 2 verified.

**17 library updates**
Each checked like any other release.

## Errors and traffic

From the app's own telemetry.

**669,352 web requests**
13% more than over the same days last month.

**101 server errors**
0.015% of requests. 12% more than over the same days last month.

**93 unhandled exceptions**
23% fewer than over the same days last month.

**44,950 background job runs**
6 failed. 6% more than over the same days last month.

### How to read this report

**Verified:** enough real traffic reached the release to compare it with how the app ran before, and nothing got worse: errors, speed, background jobs, and scheduled jobs.

**Not verified on its own:** a newer release replaced it before enough traffic arrived, or it ran out of time. A newer release's check covers its changes too.

**Problem found:** something measurably got worse after the release. The team is alerted right away, and a later release has to pass before the app counts as healthy again.
